All About Pawpaws

Sheri Crabtree, Horticulture Research and Extension Associate
Jeremy Lowe, Horticulture Research Associate
Dr. Kirk Pomper, Dean, College of Agriculture, Communities, and the Environment, Land Grant Director

What is a Pawpaw?
- Pawpaw is a native tree fruit that is found in the forest understory in Kentucky.
- The fruit’s flavor is like a tropical blend of mango and banana.
- Trees can be grown in full sun in orchards.
- This is a new unique crop for Kentucky farmers.
- George Washington, Thomas Jefferson, Daniel Boone, and Lewis and Clark ate pawpaws.

Growing Pawpaws
- Small tree, 15-20 feet tall.
- Plant trees 8-10 feet apart.
- Seedlings take 7-8 years to produce fruit; grafted trees produce fruit in 3-4 years.
- Few pests and/or diseases; can be grown organically.
- Pollinated by flies and beetles.
- Trees fruit late August to early October.
- Recommended varieties include: KSU-Atwood®, KSU-Benson®, NC-1, Overleese, Sunflower, Shenandoah, Wabash, Potomac, Susquehanna.

What Can You Do with Pawpaws?
- Eat the fruit fresh from the tree.
- The green skin and row of large seeds are inedible; soft yellow-orange flesh is the part you eat.
- Fruit is nutritious and high in antioxidants.
- Baking recipes; can be used as a substitute for banana.
- Process into ice cream or jam.
